INTRODUCTION

The opioid epidemic affects all generations—even those unborn.¹ Fetuses can be exposed *in utero* to substances that a pregnant woman ingests.² State courts are arriving at different conclusions about how to handle these expectant mothers’ drug use: specifically,

---

whether women should be held criminally liable.\textsuperscript{3} These women may not have started to use opioids for illicit purposes.\textsuperscript{4} In fact, they may have taken steps to mitigate the adverse effects of opioids on their fetus.\textsuperscript{5} However, courts are finding these women criminally liable without taking the disease of addiction or a woman’s intent into account.\textsuperscript{6} Notably, fathers are not prosecuted.\textsuperscript{7} This crime is only being prosecuted against a single gender: women.\textsuperscript{8}

This article proposes that prosecuting women for child endangerment to a fetus is a gender-based crime,\textsuperscript{9} violative of the Equal Protection Clause of the Constitution.\textsuperscript{10} Opening the door to litigation for opioid use during pregnancy can lead to the prosecution of women for their lack of prenatal care,\textsuperscript{11} which disproportionately affects marginalized women from lower socioeconomic backgrounds.\textsuperscript{12} Prosecuting women is not deterring them from abusing drugs during pregnancy; rather, it is forcing women to forego basic medical care for fear of serving prison time and losing custody of their unborn child.\textsuperscript{13} Part I of this article provides a brief history of the constitutional protections for women under the Equal Protection Clause and Due Process Clause. Part II gives an overview of the opioid epidemic. Part III discusses the dichotomy between state judicial and legislative approaches to women who give birth to children addicted to opioids. Part IV argues that prosecuting women for ingesting drugs during pregnancy creates a gender-based crime that perpetuates gender stereotypes. Finally, this article concludes that prosecuting women for prenatal conduct violates the Equal Protection Clause.

I. CONSTITUTIONAL PROTECTIONS

The United States Constitution was enacted to curtail government infringement of citizens’ rights.14 Mothers, as well as all other citizens, are entitled to rights that protect them from government interference under the Equal Protection and Due Process Clauses of the Fourteenth Amendment.15

A. The Equal Protection Clause

The Equal Protection Clause defends protected classes of individuals to ensure that similarly situated people are not treated differently.16 Equal Protection warrants judicial scrutiny at differing levels.17 Strict scrutiny requires that the law at issue be narrowly tailored to the accomplishment of a compelling government interest.18 Rational basis scrutiny requires only that a challenged statute be rationally related to a legitimate state purpose.19 The United States Supreme Court has also found an “intermediate scrutiny plus” standard for gender classifications.20 This requires a state to provide an “exceedingly persuasive justification” that the challenged law is substantially related to some important governmental objective.21

Statutes that distinguish between males and females are subject to scrutiny under the Equal Protection Clause.22 In fact, the creation of a gender-based crime involving heightened sanctions must be substantially related to the achievement of its purpose.23

In United States v. Virginia,24 the United States Supreme Court held that the Constitution precludes public institutions from being accessible solely to men.25 The Court found that “a party seeking to uphold [a] government action based on sex must establish an ‘exceedingly persuasive justification’ for the classification.”26 To

succeed in an action based on sex, the state must show "at least that the classification serves 'important governmental objectives and that the discriminatory means employed' are 'substantially related to the achievement of those objectives.'" 27 The Court soundly noted that sex classifications "may not be used, as they once were, . . . to create or perpetuate the legal, social, and economic inferiority of women." 28 Just as states can have some role in the Due Process context, 29 states also control the "gates to opportunity" under Equal Protection. 30 However, states "may not rely on 'overbroad' generalizations to make 'judgments about people that are likely to . . . perpetuate historical patterns of discrimination.'" 31 The Court closed by reminding the courts below that gender-based classifications are subject to heightened scrutiny. 32

Notwithstanding, the Court has upheld gender classifications based on stereotypes. 33 To be upheld, the laws must satisfy an important governmental objective. 34 Reduction in economic disparity between men and women caused by "the long history of discrimination" has been recognized as such an objective. 35 However, "the mere recitation of a benign, compensatory purpose is not an automatic shield which protects against any inquiry into the actual purposes underlying a statutory scheme." 36 Statutes that discriminate based on gender have been upheld, but the law must still satisfy the heightened standard. 37

Pregnancy discrimination, which has been reviewed by the United States Supreme Court, has seen an evolution of greater protection. 38 The Court began its analysis in Geduldig v. Aiello, 39 where it held that an employment insurance package was constitutional where it excluded pregnancy as a disability. 40 The Court stated that this was not in violation of the Equal Protection Clause

because “[t]he program divides potential recipients into two groups—pregnant women and nonpregnant persons. While the first group is exclusively female, the second includes members of both sexes.”\textsuperscript{41} However, the Court did not comment on the decision of whether pregnancy discrimination was sex discrimination by opining that, “[w]hile it is true that only women can become pregnant, it does not follow that every legislative classification concerning pregnancy is a sex-based classification . . .”\textsuperscript{42}

Congress has since passed the Pregnancy Discrimination Act, which finds that for purposes of the Civil Rights Act of 1964,\textsuperscript{43} pregnancy discrimination is sex discrimination.\textsuperscript{44} Following the Act’s passage, the Court refined its prior holding in \textit{Nashville Gas Co. v. Satty}.\textsuperscript{45} In \textit{Satty}, the Court found that pregnancy discrimination may be sex discrimination.\textsuperscript{46} However, until the Supreme Court has held definitively that pregnancy discrimination is subject to heightened scrutiny, like gender discrimination, pregnancy discrimination may be subject only to a rational basis standard.\textsuperscript{47}

\section*{B. The Due Process Clause}

The right of privacy is recognized as a “liberty” interest under the Due Process Clause of the Fourteenth Amendment.\textsuperscript{48} Privacy is an implicit fundamental right that protects citizens from governmental intrusion.\textsuperscript{49} Privacy has been interpreted to include the “interest in independence in making certain kinds of important decisions.”\textsuperscript{50} Decisional privacy, such as when a mother chooses to continue or terminate her pregnancy,\textsuperscript{51} is designed to protect personal affairs, that are central to an individual’s person, from

\end{thebibliography}
governmental intrusion. Once an interest has been classified as a fundamental right, then the government must show a compelling reason to intervene in order to survive strict scrutiny.

The right of privacy was first established by the United States Supreme Court in a First Amendment case that held that parents have the right to educate their children as they choose. Since then, the right of privacy has been contemplated and found in matters of marriage and family life. “Liberty presumes an autonomy of self that includes freedom of thought, belief, expression, and certain intimate conduct,” and protects the person from unwarranted government intrusions into a dwelling or other private place.

There is considerable support for the right to privacy encompassing the right to procreate, but a fetus’ right of autonomy is part of ongoing dispute. The decision to bear children is “at the very heart” of these constitutionally protected choices. In Griswold v. Connecticut, the United States Supreme Court recognized that married couples have a right to privacy in the context of contraception. The Court emphasized that not only does the Fourteenth Amendment protect privacy, but that “the First Amendment has a penumbra where privacy is protected from governmental intrusion.” Further, the Fourth and Fifth Amendments have been described “as protection against all governmental invasions ‘of the sanctity of a man’s home and the privacies of life.’” The Court concluded that the right of privacy is a protected right.

53. See Roe, 410 U.S. at 155.
55. See, e.g., Obergefell v. Hodges, 576 U.S. 644, 675 (2015) (holding same-sex couples have a fundamental right to marry); Roe, 410 U.S. 113 (recognizing a right to choose whether to terminate pregnancy); Loving v. Virginia, 388 U.S. 1, 12 (1967) (holding that there is a right to choose one’s spouse irrespective of race); Griswold v. Connecticut, 381 U.S. 479, 485 (1965) (recognizing a right to procreate); Pierce v. Soc’y of Sisters, 268 U.S. 510, 535 (1925) (holding there is a right to select the type of schooling of children in one’s custody).
57. Exploring the right of a fetus to bodily autonomy is beyond the scope of this article. Instead, the focus of this article is the autonomy of mothers to carry their pregnancy to full-term without being forced to face criminal charges.

63. Id. at 485; see also id. at 491 (“To hold that a right so basic and fundamental and so deep-rooted in our society as the right of privacy in marriage may be infringed because that right is not guaranteed in so many words by the first eight amendments to the Constitution is to ignore the Ninth Amendment and to give it no effect whatsoever.”) (Goldberg, J., concurring).
The Supreme Court has continued to extend the right of privacy.\textsuperscript{64} In \textit{Eisenstadt v. Baird},\textsuperscript{65} the Court recognized a right to privacy for unmarried individuals to have contraceptives.\textsuperscript{66} The Court emphasized that “[i]f the right of privacy means anything, it is the right of the individual . . . to be free from unwarranted governmental intrusion into matters so fundamentally affecting a person as the decision whether to bear or beget a child.”\textsuperscript{67}

In \textit{Roe v. Wade},\textsuperscript{68} the court addressed that women have a right to privacy in their decision to terminate a pregnancy.\textsuperscript{69} The Court began by stating the limits of personal privacy, yet acknowledged that the right has extended into marriage, procreation, and child rearing.\textsuperscript{70} The Court concluded that the decision to have an abortion is a protected right of privacy, but it “is not absolute and is subject to some limitations; and that at some point the state interests as to protection of health, medical standards, and prenatal life, become dominant.”\textsuperscript{71} Notably, however, “the word ‘person,’ as used in the Fourteenth Amendment, does not include the unborn,”\textsuperscript{72} thus, fetuses are not entitled to Due Process rights and Equal Protection under the law.\textsuperscript{73} Although fetuses do not receive this protection, the Court recognized that the state “does have an important and legitimate interest in preserving and protecting the health of the pregnant woman . . . and that it has still [another] important and legitimate interest in protecting the potentiality of human life.”\textsuperscript{74} The state’s interest in both the pregnant woman and the fetus grows as the woman comes to term.\textsuperscript{75}

Later, in \textit{Planned Parenthood of Southeastern Pennsylvania v. Casey},\textsuperscript{76} the Court refined its holding in \textit{Roe}, and explained that although the State has an interest in preserving the life of both the born and unborn, “[b]efore viability, the State’s interests are not strong enough to support a prohibition of abortion or the imposition of a substantial obstacle to the woman’s effective right to elect the

The Court established that the liberty guaranteed by the Due Process Clause is a “rational continuum” and “includes a freedom from all substantial arbitrary impositions” such that it requires “particularly careful scrutiny” when a state attempts to abridge this right.\textsuperscript{78}

II. THE OPIOID EPIDEMIC

Every day, more than 130 people die in the United States from overdosing on opioids.\textsuperscript{79} Use and abuse of opioids and opiates has transformed our society.\textsuperscript{80} These opioids, consisting of prescription pain relievers, heroin, codeine, oxycodone, and synthetic opioids, like fentanyl, affect the youngest to oldest members of society.\textsuperscript{81} Prescriptions for opioids increased in the late 1990s and have since surged since the 2010s.\textsuperscript{82} The number of prescriptions becomes even more alarming upon discovering that approximately three out of four new heroin users say they abused prescription opioids before turning to heroin.\textsuperscript{83} The Center for Disease Control (CDC) estimates that the “economic burden” of prescription opioid misuse, in the United States alone, is $78.5 billion per year, including costs of healthcare and criminal justice involvement.\textsuperscript{84}

The Opioid Crisis is not new; rather, litigation has been ongoing since the early 2000s,\textsuperscript{85} involving oxycodone (OxyContin).\textsuperscript{86} Purdue Pharma, a manufacturer of OxyContin, produced documents during

litigation detailing how the company down-played the drug’s risk of abuse and addiction.87 However, this leaked information is one of only few pieces revealed to the public due to drug companies pursuing settlement.88 Though, the tides may change soon because the population harmed by opioids continues to grow and may lead to more class action lawsuits due to similar factual circumstances—for example, newborns with Neonatal Abstinence Syndrome (NAS).89

NAS is a withdrawal symptom that “impacts newborns who were exposed to opioids in utero, and then are rapidly shut off from access to the drug at birth.”90 Effects include “excessive high-pitched cry, reduced quality and length of sleep after a feeding, increased muscle tone, tremors, and convulsions . . . dysregulation ([including] sweating, frequent yawning and sneezing, increased respiration) and gastrointestinal signs ([such as] excessive sucking, poor feeding, regurgitation or vomiting, and loose or watery stools).”91 Hospitals are becoming inundated with babies born with NAS: citing a rise from 13,500 in 2009 to 25,000 in 2016.92 In Pennsylvania alone, NAS rates increased by over one thousand percent between 2000 and 2018.93 Despite the severity of symptoms, there is little research discussing the impact of pregnant opioid use or NAS on long-term brain development.94 The uncertainty of the long-term impact of NAS has generated much debate about whether pregnant women should be prosecuted for drug use.95

Like all drug addiction, opioid addiction is a disease.96 The World Health Organization promulgated an authoritative definition of

heroin addiction, which lists characteristics such as a “strong desire or need to continue taking the drug,” “a psychic dependence on the effects of the drug,” and “a physical dependence on the effects of the drug requiring its presence for maintenance of homeostasis and resulting in a definite, characteristic, and self-limited abstinence syndrome when the drug is withdrawn.” Congress has also defined “addict” to include one “who is so far addicted to the use of narcotic drugs as to have lost the power of self-control with reference to his addiction.”

The United States Supreme Court, in *Robinson v. California*, held that addiction is not a crime; rather, it is an illness “which may be contracted innocently or involuntarily,” and cannot be prosecuted. Justice Douglas concluded that addiction is not punishable as a crime because, “[i]f addicts can be punished for their addiction, then the insane can also be punished for their insanity. Each has a disease and each must be treated as a sick person.”

### III. Dichotomy of Approaches

Courts and legislatures have been working to identify the potential liability for drug use during pregnancy. Their efforts show the vast difference in interpreting the requirements for pregnant women.

#### A. Judicial Approach

The most frequently relied upon case for fetal child abuse due to drug addiction deals with cocaine. Regina Kilmon gave birth to a baby boy that had the presence of cocaine in his bloodstream. Ms. Kilmon was charged with second degree child abuse, reckless endangerment, and possession of a controlled substance and pled guilty to reckless endangerment. The Maryland Supreme Court looked to its child endangerment statute, where in relevant part

states, that a person recklessly “engage[s] in conduct that creates a substantial risk of death or serious physical injury to another.”108 The court held that “another” meant another person.109 As such, the person allegedly endangered by Ms. Kilmon’s conduct was not the fetus, but the child, after the child’s birth.110

The court recognized that an injury committed while a child is still in utero can produce criminal liability if the child is later born alive.111 Distinguishing Williams, the court noted that reckless endangerment, not intent to injure, is the key element of the offense.112 The court took issue that if the statute is applied to the effect of a pregnant woman’s conduct on the fetus she is carrying, it could be construed to include not just the ingestion of unlawful controlled substances “but a whole host of intentional and conceivably reckless activity that could not possibly have been within the contemplation of the Legislature . . . .”113 The court then provided a list of the potentially reckless behavior that could be captured under the reckless endangerment statute:

- everything from becoming (or remaining) pregnant with knowledge that the child likely will have a genetic disorder that may cause serious disability or death, to the continued use of legal drugs that are contraindicated during pregnancy, to consuming alcoholic beverages to excess, to smoking, to not maintaining a proper and sufficient diet, to avoiding proper and available prenatal medical care, to failing to wear a seat belt while driving, to violating other traffic laws in ways that create a substantial risk of producing or exacerbating personal injury to her child, to exercising too much or too little, indeed to engaging in virtually any injury-prone activity that, should an injury occur, might reasonably be expected to endanger the life or safety of the child. Such ordinary things as skiing or horseback riding could produce criminal liability.114

The court acknowledged that a pregnant woman, like anyone else, may be prosecuted for her own possession of controlled

114. Id.
Despite being importuned on numerous occasions, the Maryland General Assembly has “chosen not to impose additional criminal penalties for the effect that her ingestion of those substances might have on the child, either before or after birth.”

Recognizing an anomaly in the jurisprudence, the court proffered that it would be nonsensical that a pregnant woman who, by ingesting drugs and recklessly causing the death of a viable fetus, would suffer no criminal liability for manslaughter, but, if the child survived, she could be imprisoned for five years for reckless endangerment.

Subsequently, New Jersey addressed whether a pregnant woman seeking treatment for her opioid addiction can be held criminally responsible for her child being born with NAS. At a routine doctor’s appointment, Y.N. learned that she was four months pregnant. During the preceding four months, Y.N. had been taking Percocet for injuries from a car accident and became dependent on the medication. Instead, hospital staff recommended that Y.N. enter a methadone maintenance treatment program, which she did four months later, just a month before she gave birth to her son. Y.N.’s son suffered methadone withdrawal symptoms at birth and remained hospitalized for about seven weeks.

Y.N. was found strictly liable for abuse and neglect. The New Jersey Supreme Court reversed and held “absent exceptional circumstances, a finding of abuse or neglect cannot be sustained based solely on a newborn’s enduring methadone withdrawal following a mother’s timely participation in a bona fide treatment program prescribed by a licensed healthcare professional to whom she has made

A.L., 59 A.3d 576, 590 (N.J. 2013) (holding that mother had not abused or neglected her child when the infant was born with cocaine metabolites in her system because the record revealed little about any future degree of harm).
full disclosure." The court referenced the United States Department of Health and Human Services and concluded that methadone maintenance treatment can save the lives of newborns. Although the infant may experience methadone withdrawal, ultimately, it is better than the infant being addicted to heroin. The court reasoned that, finding a mother liable of abuse or neglect as a result of her newborn’s NAS diagnosis, after the mother made an informed medical decision to undergo methadone maintenance treatment, would discourage women from entering detoxification programs that may improve their child’s health.

The Vermont Supreme Court addressed a similar issue regarding whether a woman should continue her use of opioids during pregnancy. In that case, the pregnant woman revealed to a nurse that she had been using street buprenorphine. The nurse educated that she should continue to use the drug to avoid intrauterine damage to the fetus and herself if she were to suddenly stop. The nurse prescribed Subutex (buprenorphine), but her son was born opioid-dependent and required two months of treatment. The court held that because the mother was suspended from treatment, accessed un-prescribed Subutex off the street, and did not return to a medically monitored program until a month before the birth of her child, the mother was guilty of child abuse towards the fetus.

Justice Beth Robinson, concurring in part and dissenting in part, noted that the court “should not presume that every child born opioid-dependent is by definition [abused] on account of the fact that the child developed an opioid dependence in utero.” Child-protection statutes are not designed to punish prepartum conduct. Although a parent’s conduct prior to a child’s birth may support inferences about the parent’s ability to care for the child upon birth, Justice Robinson did not believe that an abuse finding is predicated

based on harm inflicted on a fetus before birth. Studies have shown that fear of punitive responses and loss of custody is a deterrent to pregnant women seeking treatment for drug addiction. A policy, presumptively holding that a child born with NAS is abused, would deter pregnant opioid-addicted women from taking steps to protect both their own health and that of their fetus.

The West Virginia Supreme Court handled the novel situation of whether a pregnant woman could be convicted of child neglect resulting in death, when a child is born addicted to methamphetamines and consequently dies. Stephanie Louk intravenously injected methamphetamines when she was thirty-seven weeks pregnant. Within a few hours of the injection, Ms. Louk began experiencing breathing problems and went to the hospital. Doctors diagnosed Ms. Louk with acute respiratory distress which, when pregnant, displaces the blood that usually goes to the fetus and diverts it back to the woman. Doctors performed an emergency cesarean, and upon delivery, the child was pronounced brain dead. The child died eleven days later. Ms. Louk was convicted of one felony count of child neglect resulting in death and sentenced to three to fifteen years’ incarceration.

Citing to Kilmon, the West Virginia Supreme Court expressed concerns that numerous prenatal activities could harm the fetus, such as poor nutrition, poor prenatal care, and caffeine consumption. The court was concerned about the same anomaly, that prenatal ingestion of drugs resulting in the birth of a surviving child would be criminalized but the same conduct resulting in the fetus dying in utero would not be criminalized. The court overturned Ms. Louk’s conviction, but stated that with the rising opioid epidemic, the legislature would need to rewrite the statute if they wanted prenatal conduct criminalized.

Most recently, the Pennsylvania Supreme Court addressed whether a woman’s use of opioids while pregnant, which results in

a child born suffering from NAS, constitutes child abuse.\textsuperscript{151} The woman was released from incarceration and relapsed into drug addiction, specifically using opioids and marijuana.\textsuperscript{152} Upon learning she was pregnant, she sought treatment for her addiction, first through a methadone maintenance program, and then with Subutex.\textsuperscript{153} She relapsed, and a couple of weeks before giving birth, she tested positive for opiates, benzodiazepines, and marijuana—none of which were prescribed to her.\textsuperscript{154} Within three days of her child being born, the child began exhibiting symptoms of NAS.\textsuperscript{155} Child and family services filed a dependency petition alleging, among other things, that the child was a victim of child abuse by a perpetrator, and the mother caused bodily injury to the child through a recent act.\textsuperscript{156}

The case was decided based on the unambiguous language of the Pennsylvania child abuse statute.\textsuperscript{157} Although the opinion primarily focused on whether the fetus was considered a child \textit{in utero} and whether the woman was considered a mother prior to birth, the court held that the woman was not a perpetrator of child abuse.\textsuperscript{158} In addition, the court opined that labeling a woman as a perpetrator of child abuse does not prevent her from becoming pregnant, and it does not ensure that the same woman will not use illegal drugs if she becomes pregnant again.\textsuperscript{159} Once given the label of a perpetrator of abuse, the likelihood that a new mother will be able to assimilate into the workforce and participate in activities in the child’s life would be diminished.\textsuperscript{160}

Contrasting with the preceding cases, the Tennessee Court of Appeals did not consider any privacy or policy considerations in favor of the mother and, rather, focused on the child when deciding prenatal opioid use.\textsuperscript{161} The appellate court addressed whether a woman’s drug use during pregnancy constituted severe child abuse where she had previously given birth to a child who was harmed by drug abuse.\textsuperscript{162} In this case, the mother had previously given birth to a child suffering from NAS, and she had been referred to a

She was expelled from the methadone clinic due to her use of methamphetamine—a violation of the clinic’s rules. About a year later, she was taken to a hospital for a possible drug overdose when she discovered she was pregnant. Subsequently, she used methadone purchased illegally and failed to receive prenatal care. Her son was born prematurely and exhibited signs of opiate withdrawal. The court held that severe child abuse can be found where a child is born injured from exposure to opiates during pregnancy.

Although the facts of each case are unique, the courts, overall, seem to be coming to nearly the same conclusion: pregnant women cannot be found criminally responsible for their prenatal use of opioids. Courts are concerned with the woman’s fundamental right to privacy. If the courts follow Tennessee’s lead and issue a finding of child abuse whenever a child is born with injuries sustained from the mother’s prenatal opioid use, it can potentially open the door to a wider range of conduct that the courts can control. However, courts have opined that the decision of criminal culpability may not be an issue for the judicial branch to handle; rather, it should be decided by the legislatures. As the West Virginia Supreme Court stated, it is for the legislature to define what constitutes child abuse and whether that includes specific prenatal conduct, including consumption of illegal substances.

### B. Legislative Approach

Maryland has created a statute that specifically addresses reporting on substance-exposed newborns. Therein, Maryland defines controlled substances to include all substances on Schedules I through V. Newborn is also defined as “a child under the age of 30 days who is born or who receives care in the State.” The

173. *Id.*
175. *Id.* § 5-704.2(a)(2).
176. *Id.* § 5-704.2(a)(4).
statute states that a new born is “substance-exposed” where the newborn:

(1) displays a positive toxicology screen for a controlled drug as evidenced by an appropriate test after birth; (2) displays the effects of controlled drug use or symptoms of withdrawal resulting from prenatal controlled drug exposure as determined by medical personnel; or (3) displays the effects of a fetal alcohol spectrum disorder.\(^\text{177}\)

Thus, the statute addresses not only prenatal drug use but also prenatal alcohol use.\(^\text{178}\) Most importantly, the statute states that “[a] report made under this section does not create a presumption that a child has been or will be abused or neglected,” thus, expressing the intent that expectant women are not subject to strict liability for prenatal conduct.\(^\text{179}\) The Legislature is leaving it to the courts to determine whether the prenatal conduct of the mother is indicative of abuse.\(^\text{180}\)

New Jersey has yet to pass a statute specifically addressing newborns and instead relies upon its general child abuse statute.\(^\text{181}\) Under the New Jersey statute, a child is defined as “any child alleged to have been abused or neglected.”\(^\text{182}\) An abused or neglected child is “a child less than 18 years of age whose parent or guardian . . . inflicts or allows to be inflicted upon such child physical injury by other than accidental means which causes or creates a substantial risk of death, or serious or protracted disfigurement . . . .”\(^\text{183}\) The statute is quite broad and allows courts to interpret the statute as they see fit.\(^\text{184}\) However, the New Jersey legislature has introduced multiple bills in the last few years seeking to address substance-exposed newborns, indicating that the legislature may, in a few years, more strictly define abuse in this context.\(^\text{185}\)

West Virginia views controlled substance use during pregnancy as falling under its child neglect statute.\(^\text{186}\) Therein, the statute simply refers to whether a parent, guardian, or custodian, neglects

a child under his or her custody or control. This is one of the broadest statutes and makes no reference to what constitutes neglect or abuse. This provides courts with broad discretion in their decision-making. The West Virginia Supreme Court in *Louk* called for a stricter statute due to this broad power. Because West Virginia is the leader in opioid overdoses, it is likely that a stricter statute will be created.

Similarly to New Jersey and West Virginia, Pennsylvania also does not have a statute specifically addressing newborns affected by NAS. Integral in the decision of *In re L.J.B.*, was the definition of perpetrator of abuse, postulating that it must be, among others, the parent of the child. Child abuse is defined as “intentionally, knowingly[,] or recklessly . . . [c]ausing bodily injury to a child through any recent act or failure to act.” In the case, the opinion turned upon the definition of parent and child, which in the statute, does not specifically address whether a fetus is a child and at what point one becomes a parent.

Tennessee, although not possessing a statute solely addressing prenatal conduct, does have provisions dealing with child abuse resulting from consumption of illegal substances. A child is defined as anyone under eighteen years of age. Severe child abuse is defined as “[t]he knowing exposure of a child to or the knowing failure to protect a child from abuse or neglect that is likely to cause serious bodily injury or death . . . .” Severe child abuse can also be found where a parent knowingly allows a child “to be present within a structure where the act of creating methamphetamine . . . is occurring . . . .” Furthermore, severe child abuse exists where a parent “[k]nowingly or with gross negligence allow[s] a child under eight

(8) years of age to ingest an illegal substance or a controlled substance that results in the child testing positive on a drug screen, except as legally prescribed to the child."\textsuperscript{200} As the court found in \textit{In re Benjamin M.}, a child also includes a fetus.\textsuperscript{201} Although the statute does not specifically address fetal conduct, the statute can be construed to a finding of child abuse.\textsuperscript{202}

Florida has specifically addressed substance exposure in newborns.\textsuperscript{203} Harm is found where a child has been exposed to a controlled substance or alcohol.\textsuperscript{204} This can be determined by "[a] test, administered at birth, which indicate[s] that the child’s blood, urine, or meconium contained any amount of alcohol or a controlled substance or metabolites of such substances, the presence of which was not the result of medical treatment administered to the mother or the newborn infant."\textsuperscript{205} Florida has specifically carved out that a mother has harmed her child, but this is not a presumptive finding of child abuse.\textsuperscript{206} Florida, like the states above, has left it to the discretion of the courts.\textsuperscript{207}

States have implemented new statutes and regulations to better protect babies born with NAS and get care for women addicted to opioids.\textsuperscript{208} Twenty-five states and the District of Columbia require health care professionals to report suspected prenatal drug use.\textsuperscript{209} Eight states require health care professionals to test for prenatal drug exposure if they suspect drug use.\textsuperscript{210} Nineteen states have either created or funded drug treatment programs specifically targeting pregnant women,\textsuperscript{211} and an additional seventeen states and the District of Columbia provide pregnant women with priority access

to state-funded drug treatment programs.\textsuperscript{212} Moreover, ten states prohibit publicly funded drug treatment programs from discriminating against pregnant women.\textsuperscript{213}

State legislatures are taking a wide array of approaches to address the opioid epidemic’s effect on newborns.\textsuperscript{214} As the opioid epidemic continues, more legislation specifically addressing substance exposure in newborns, like in Maryland, will likely be written.\textsuperscript{215} As seen in Maryland and Florida, the statutes not only address opioids but other illegal substances and alcohol.\textsuperscript{216} As other states write or amend their legislation, opioids, alcohol, and possibly other prenatal conduct may be introduced as a finding of harm to a fetus.\textsuperscript{217}

\section*{IV. CRIMINALIZING PREGNANCY CREATES A GENDER-BASED CRIME}

Most states, and the federal government, criminalize “substance possession, not use, criminalizing substance use during pregnancy represents an expansion of the criminal law.”\textsuperscript{218} This expansion of criminal law will only be prosecuted against those people who can become pregnant: women.\textsuperscript{219} Thus, because pregnancy is a necessary element of substance use during pregnancy, this criminalization creates a gender-based crime.\textsuperscript{220}

These statutes have treated pregnancy as an essential element for criminal prosecution, thereby exclusively crafting a statute that applies to women and no one else.\textsuperscript{221} Looking at a study between 1973 and 2005, most of the more than 400 interventions of pregnant women for substance use during pregnancy,\textsuperscript{222} “pregnancy provided

\end{itemize}
a ‘but for’ factor, meaning that but for the pregnancy, the action taken against the woman would not have occurred.”

The most common response to why substance use should be criminalized during pregnancy is that the criminal justice system operates as an effective deterrent to convince pregnant women with substance use disorder to get treatment. The idea is that a pregnant woman suffering from drug dependence will choose treatment, thereby increasing the probability that she will stop abusing drugs and give birth to a healthy child.

However, criminalizing substance use during pregnancy opens the door to a slippery slope for the criminalization of other activities—even legal activity—that can pose a risk to fetuses. This is far from a novel idea: women have historically been refused the opportunity to have certain jobs and equal employment benefits. Today, new legislation has been proposed to criminalize cigarette smoking by pregnant women, but this may just be the beginning. This endangers not only women who use opioids during pregnancy, but even women who fail to obtain prenatal care.

Lynn Paltrow, program director of National Advocates for Pregnant Women, states that “according constitutional rights to fetuses would not only jeopardize women’s lives and health by denying them access to legal abortion[s], but would also undermine substantially their status as constitutional persons including their ability to participate as full and equal citizens in our society.” If a woman is held criminally responsible, then she may be listed on a child abuse registry

230. See, e.g., Antonia Noori Farzan, Yes, You Can Fail a Drug Test by Eating a Poppy Seed Bagel, as a Maryland Mother Learned, WASH. POST (Aug. 8, 2018, 6:22 AM), https://www.washingtonpost.com/news/morning-mix/wp/2018/08/08/yes-you-can-fail-a-drug-test-by-eating-a-poppyseed-bagel-as-a-maryland-mother-learned/ (explaining that mothers have been reported to state services for testing positive for opiates without allowing mothers to explain that they had eaten a poppy seed bagel).
which can result in potential reputational harms, such as impeding the ability to obtain employment. Thus, the more rights and protections that are given to fetuses, the fewer that remain for the woman who carries the fetus.

Although violating the fundamental right to bear children is, on its own, enough to trigger strict scrutiny under Equal Protection, the protected status of addiction is also subject to heightened scrutiny. If “drug use by pregnant women is [a crime], then pregnancy constitutes ‘a necessary element of a remarkable new status-based criminal offense: [p]regnancy by a drug-dependent person, or drug use by a pregnant woman.’” It is the “coexistence of two unpunishable statuses—a drug addiction and pregnancy”—that results in the creation of a “new status crime.”

Moreover, prosecuting pregnant women violates Equal Protection because this robs women of the fundamental right to bear children. The right to procreate is “one of the basic civil rights . . . .” Skinner clearly held that the right to beget a child is a fundamental right that cannot be abridged without satisfying strict scrutiny. Punishing mothers who are drug-addicted burdens their right to bear children. Here, although there is a state interest in protecting the life of fetuses, there is currently not enough research to determine how much opioid use during pregnancy will affect the fetus, or even if there will be any long-term effects. Moreover, states are only recognizing the woman’s role in fetal health, and failing to recognize the male role. By prosecuting women for their prenatal conduct, courts are punishing

232. See Kane v. Comm’r of Dep’t of Health & Hum. Servs., 960 A.2d 1196, 1202 (Me. 2008) (holding that “[t]he stigma of being listed as ‘substantiated’ for child abuse combined with the adverse professional and social consequences of being listed in the database implicates a fundamental liberty interest.”).

women for addiction and opening the floodgates to future litigation for other conduct.244

A. Criminalizing Pregnancy Perpetuates Gender Stereotypes

Legislators focus exclusively on the pregnant woman’s role in the health of the fetus, while failing to recognize that men also have an impact.245 The United States Supreme Court opined that male health may have just as much influence on the fetus as the expectant woman’s health.246 A man’s exposure to toxins in his workplace can be potentially damaging to fetal development.247 There is even a similarly proposed potential harm linking paternal drug use and fetal health.248 Both male and female alcohol consumption decreased the chance of a live birth and increased the risk of a miscarriage.249

Smoking can also damage sperm DNA.250 For example, heavy smoking by a man at the time of conception “increases the child’s risk of childhood leukemia and shortens [the] reproductive lifespan of daughters.”251 Beyond the effect that exposure to toxins, smoking, and drinking alcohol have on a man’s sperm, his “drug use in the presence of a pregnant partner could potentially further impact fetal health . . . .”252 Legislators’ refusal to incorporate the male’s role in fetal health merely continues the stereotypes of parenthood.253

B. Prosecuting Women Fails to Deter Drug Use

Women are being treated as incubators for new life while their fundamental interests in liberty and freedom of autonomy are

constrained. Five states have enacted laws that authorize the civil commitment and detention of pregnant women for their use of drugs and alcohol. These laws have been criticized as permitting an unconstitutional deprivation of liberty. Specifically, Wisconsin’s statute was struck down as violative of the Due Process Clause because it “affords neither fair warning as to the conduct it prohibits nor reasonably precise standards for its enforcement.” Paltrow commented that the continued enforcement of civil commitment law:

"takes away from a pregnant woman virtually every right associated with constitutional personhood—from the most basic right to physical liberty to the right to refuse bad medical advice . . . [t]his kind of dangerous, authoritarian state-action, is exactly what happens when laws give police officers and other state actors the authority to treat fertilized eggs, embryos, and fetuses as if they are already completely separate from the pregnant woman."

The American College of Obstetrics and Gynecologists argues that “punitive policies are potentially counterproductive because they are likely to discourage prenatal care and successful treatment while undermining the patient-physician relationship.” Instead, legislators, judges, and prosecutors are choosing to criminalize pregnancy and push opioid-using women away from prenatal care.

Courts acknowledge that prosecuting pregnant women potentially incentivizes abortion because the law better protects a drug addicted woman who chooses to terminate her fetus than a woman who gives birth to a child after abusing substances during her pregnancy. This does not deter women from stopping consumption of

opioids; rather, these prosecutions deter pregnant women from seeking prenatal care and drug counseling.263

C. Women and Fetal Rights

Fetal rights have been recognized by Congress under the Unborn Victims of Violence Act (UVVA).264 The UVVA makes conduct causing the death or injury of a fetus a separate offense, punishable by the same sentence, such as in cases of murder or assault.265 The UVVA applies where the individual killed was a pregnant woman, regardless of the actor’s intent and whether or not the actor knew the woman was pregnant, effectively making the Act strict liability.266 However, the UVVA does not apply to prosecutions of pregnant women for giving birth to a child while addicted to opioids.267 In fact, the language of the UVVA specifically exempts any act a woman undertakes regarding her fetus.268

There is limited information regarding what impact, if any, pregnant opioid use or NAS has on long-term brain development.269 Some studies suggest that elementary school children who were exposed to opioids in utero may exhibit “motor and cognitive impairments,” including higher instances of Attention-Deficit/Hyperactivity Disorder.270 However, the little amount of research that does exist was completed prior to the widespread use of highly potent synthetics, such as fentanyl.271

Although the long-term effects are unknown, it is undisputed that the majority of newborns exposed to opioids in utero will experience withdrawal.272 Treating a fetus suffering from withdrawal—not considering the other physical ailments—increases the costs of the health system.273 An analysis done by the Pennsylvania Health Care Cost Containment Council found that the hospital care for all

babies born with substance abuse issues added 27,385 hospital days in Pennsylvania alone.\textsuperscript{274} This cost Medicaid an additional $20.3 million dollars.\textsuperscript{275} These numbers may sound astronomical, but the average length of a hospital stay for a baby with NAS is thirty days.\textsuperscript{276} Once these babies do go home, they are at a higher risk of neglect or abuse under the care of mothers still battling addiction.\textsuperscript{277}

Current therapies, such as opioid agonist therapy,\textsuperscript{278} may increase the number of NAS cases.\textsuperscript{279} Currently, there is no way to know whether the infants exposed to NAS \textit{in utero} were exposed to opioid agonist therapy or to illicit opioids.\textsuperscript{280} What was discovered, however, is that women with opioid use disorder undergoing opioid agonist therapy showed improved outcomes for the mother and child.\textsuperscript{281}

\textbf{D. Women Should Not Be Prosecuted for Addiction}

In 1962, the United States Supreme Court held that drug addiction is an illness that cannot be criminally punished.\textsuperscript{282} Opioid addiction rewires the brain.\textsuperscript{283} The first stage, known as intoxication, involves opioids producing a reward sensation in the brain.\textsuperscript{284} The second stage, known as negative affect, causes the brain to need more of the opioid to experience the reward sensation, and withdrawal begins when the drug is not obtained.\textsuperscript{285} Finally, the brain enters preoccupation-relapse, which involves chronic relapse, often

\begin{flushleft}
\textsuperscript{275} Id.
\textsuperscript{276} Id.
\textsuperscript{278} Jonathan Giftos & Lello Tesema, \textit{When Less Is More: Reforming the Criminal Justice Response to the Opioid Epidemic}, 57 JUDGES’ J. 28 (2018) ("Buprenorphine and methadone . . . mimic short-acting opioids such as heroin or oxycodone by binding to the same receptors in the brain . . . . [I]t prevents onset of withdrawal symptoms and . . . block[s] the euphoric response to additional opioids the patient may take, thereby reducing the incentive to use.").

\textsuperscript{284} Id.
\textsuperscript{285} Id.
\end{flushleft}
triggered by external cues. Although these brain modifications occur in other addictions, such as alcoholism, the “women targeted for prosecution based on addiction do not engage in any act other than giving birth.”

The National Institute on Drug Abuse suggests that treatment success should be holistic and include a combination of approaches that address the entire patient, such as her “age, race, culture, sexual orientation, gender, pregnancy, housing and employment, as well as physical and sexual abuse.” In July of 2016, Congress passed the Comprehensive Addiction and Recovery Act (CARA), a bipartisan effort to help curb the opioid crisis. CARA outlines a number of harm reduction efforts, including a stipulation that treatment for pregnant women should be prioritized. This legislation is certainly a step in the right direction for women to obtain treatment, but this may still result in them losing custody of their children.

Furthermore, the United States Supreme Court has consistently drawn a distinction between a state requiring a benefit for pregnant women and a state imposing a burden on pregnant women. The passage of the Pregnancy Discrimination Act showed Congress’ intent that pregnant women are a protected class under the Civil Rights Act of 1964. The Court has also held that prosecuting pregnancy and drug addiction, both of which are independently protected statuses, violates the Equal Protection Clause. Although there is no constitutionally recognized right to use illicit drugs, one does have a constitutionally protected right not to be punished simply for being addicted.

Thus, even for parents receiving effective, evidence-based treatment, the goal of operating within the timeframe is often unreachable.”).
292. Ehrlich, supra note 46, at 399–400.
294. Ehrlich, supra note 46, at 412.
CONCLUSION

Although the opioid epidemic is sending shock waves through society, the answer to this crisis does not lie in prosecuting women for the prenatal use of illicit substances. This punishment tactic does not deter women from taking opioids; rather, it encourages pregnant women to not seek prenatal care. Due to the possibility of facing criminal punishment, women may even feel pressured to terminate their pregnancy. States have created a gender-based crime, arguably violating Equal Protection, when states should instead be seeking new treatment methods for all that have fallen victim to the disease of addiction.

State legislatures and courts need to work together to better protect children born with NAS, without punishing an expectant woman’s prenatal conduct. States could potentially hold expectant fathers’ criminally responsible for their role in fetal health; however, courts would still be penalizing individuals for their addiction. Thus, instead of prosecuting women for their role in fetal health, courts and legislators should seek to better help women by providing rehabilitation and counseling.
